.net developer training

Create XML Web Services and Applications with Visual Studio .NET

Building ASP® .NET Applications

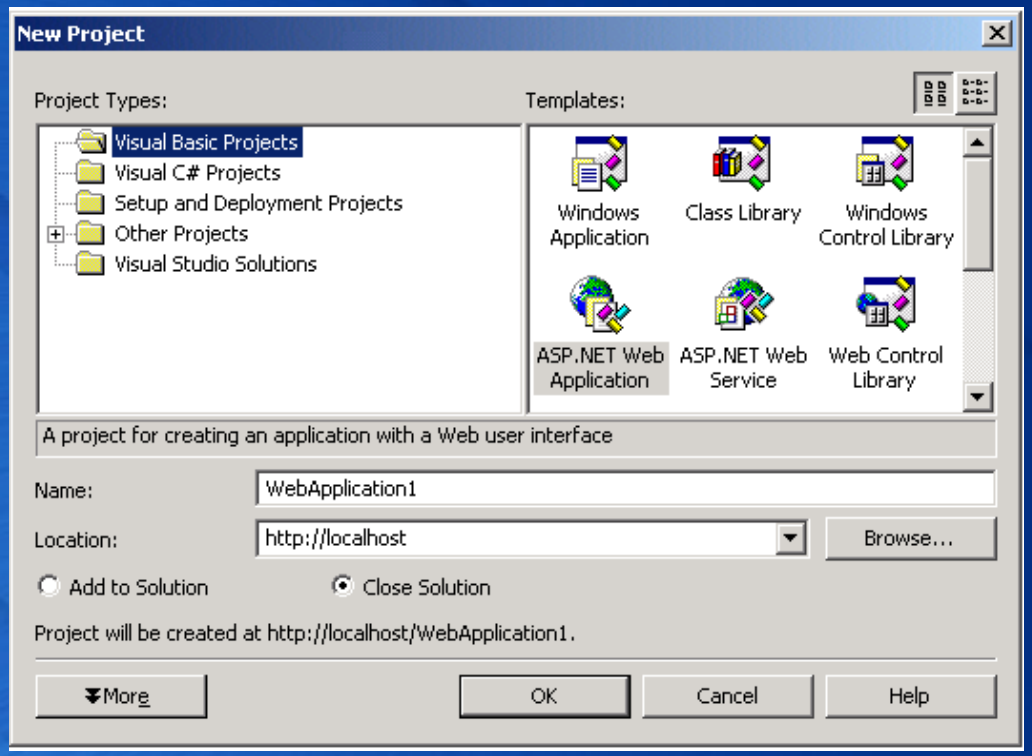
Module 05 Agenda

- Introduction
- ASP .NET
  - Platform
  - Page development
  - “Baked-in” application services
  - Run time

Introduction
Active Server Pages .NET

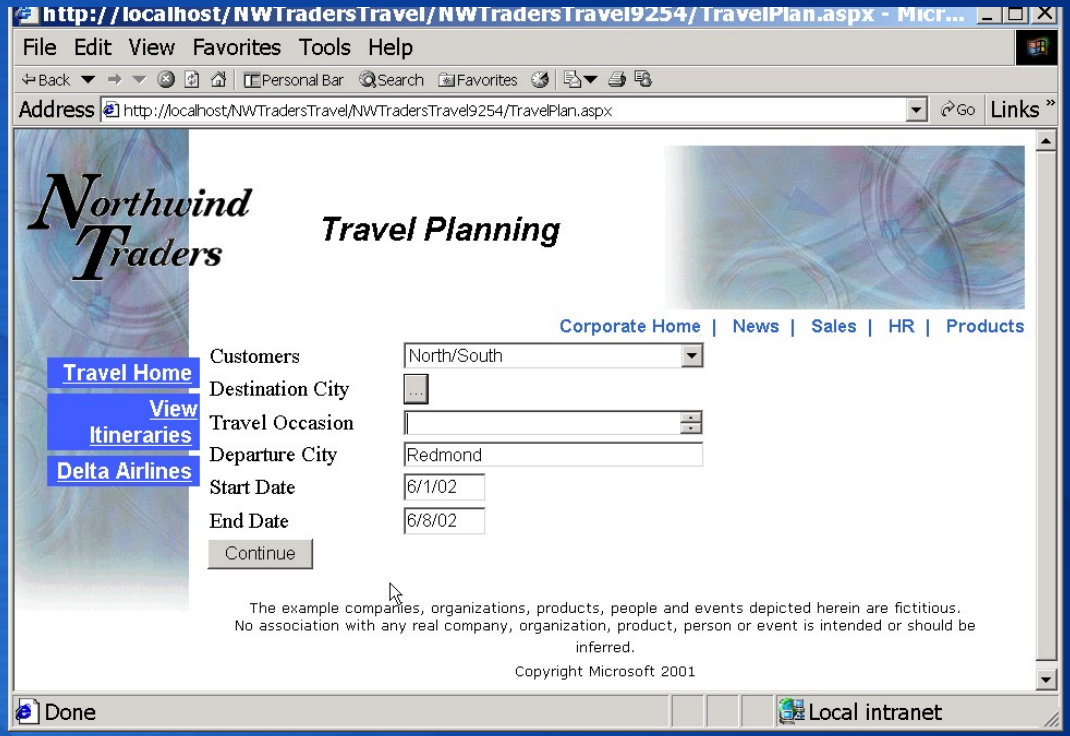
ASP .NET and Visual Studio® .NET are designed for Web Applications

- Designed for Web Applications and XML Web services
- Drag and drop for controls and HTML features
- Rich language integration



Introduction
ASP .NET

- Builds on the programming classes of the .NET Framework
- Controls and infrastructure simplify the building of Web Applications

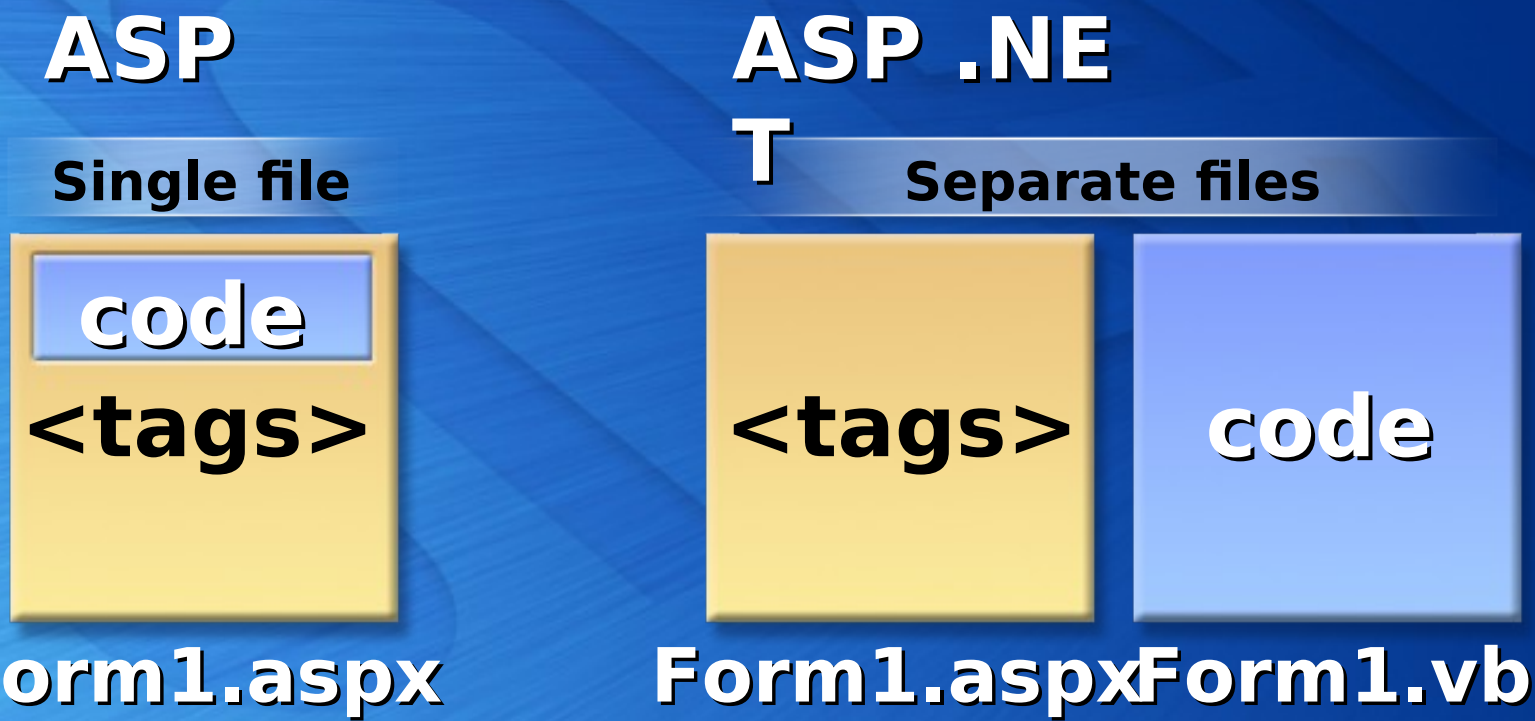


Page Development Topics

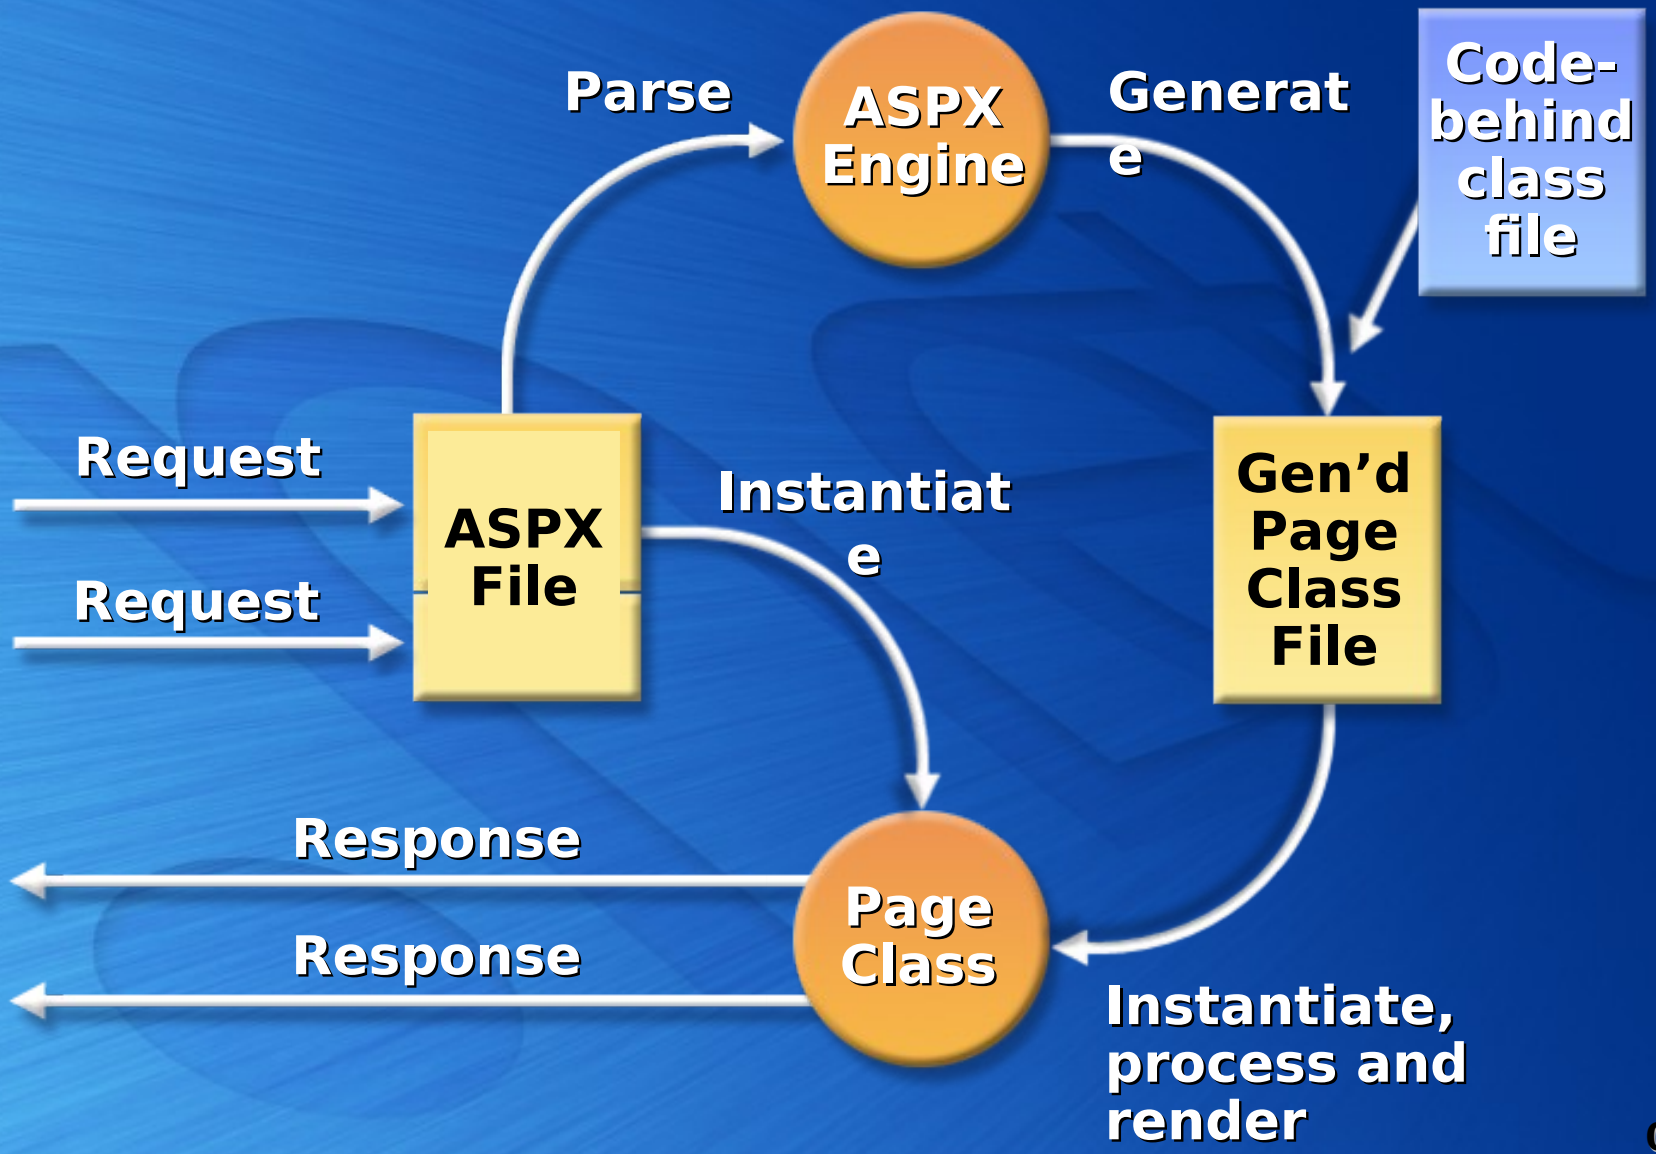
- Separation of Code from Content
- Dynamic Compilation
- Server Controls
- Validation
- Custom Controls
- Page Event Life Cycle

Page Development
Separation of Code from Content

- Separation of Code from Content
  - Developers and designers can work independently



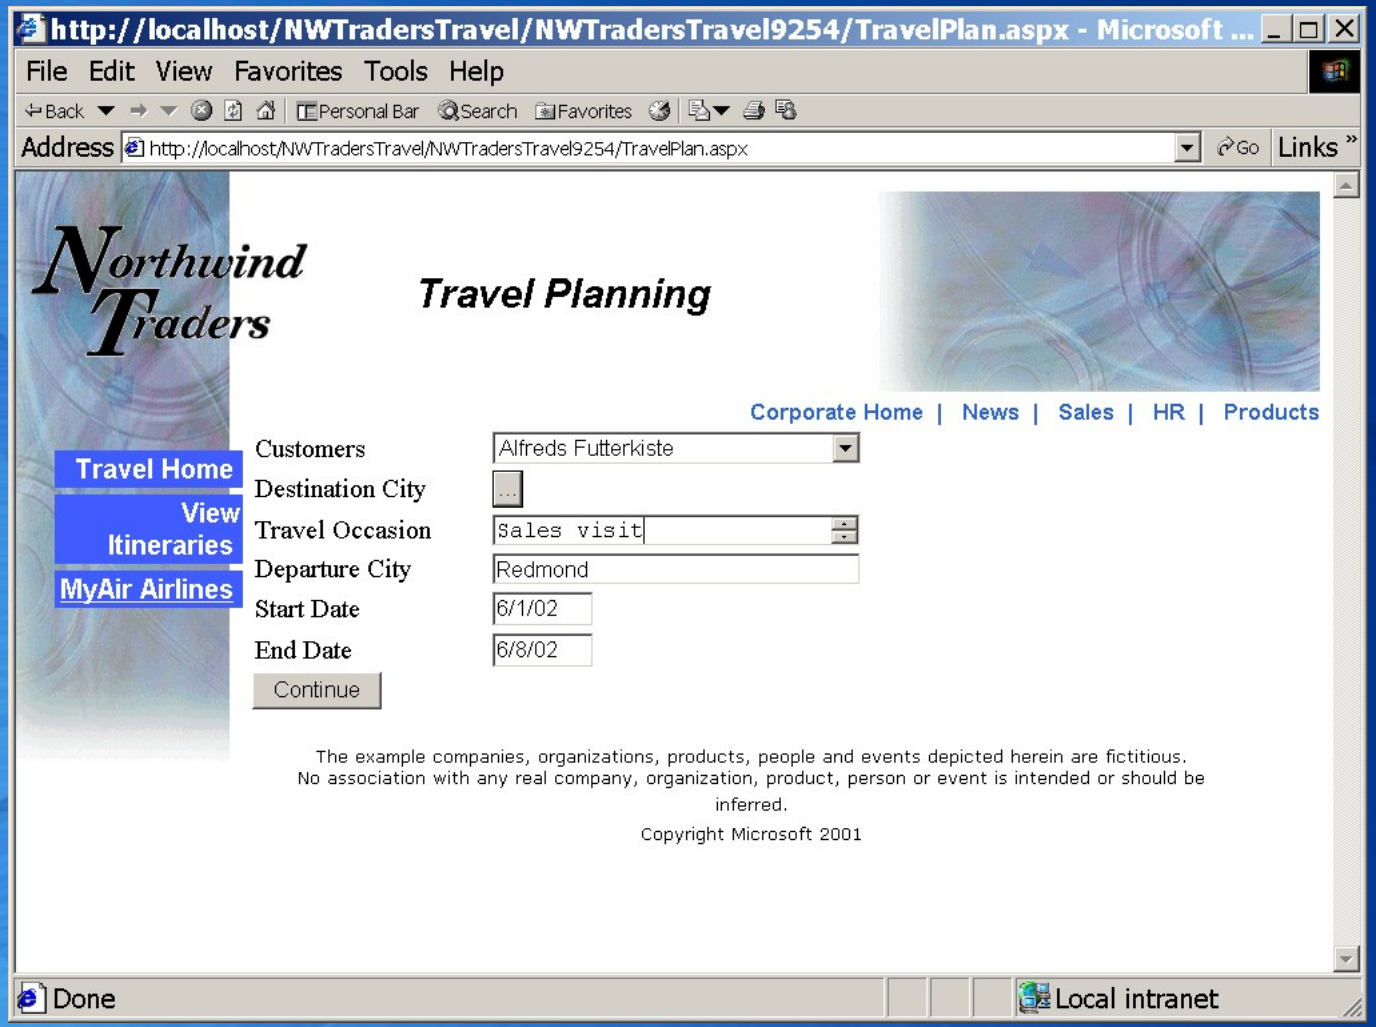
Page Development
Dynamic Compilation



Page Development
Server Controls

- Server-programmable objects
  - Properties, method and events
- Encapsulate behavior
- Browser-neutral - Can render differently to support multiple browsers or other Web clients
- You can create custom server controls

Page Development
Server Controls



Page Development
Page Event Life Cycle

Page is loaded, control hierarchy initialized

Page_Load

Control events

1. Change Events — **Textbox1_Changed**

2. Action Events — **Button1_Click**

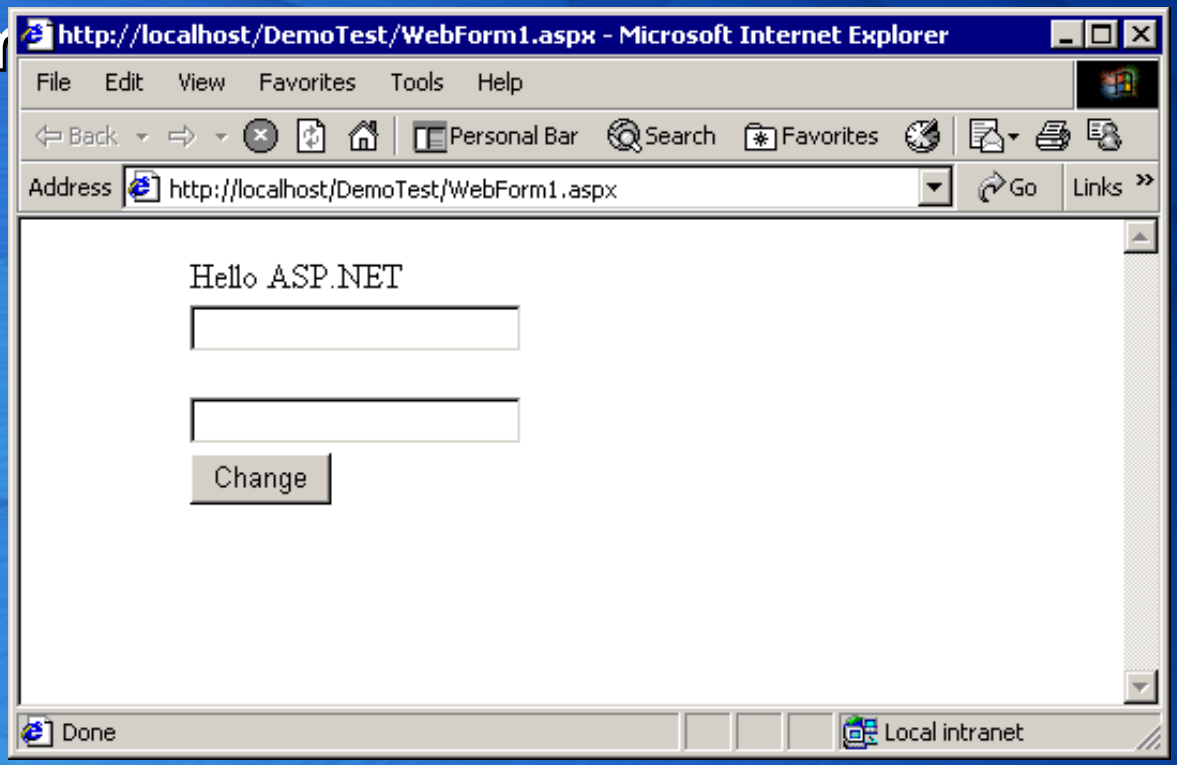
Control hierarchy is rendered

Page_Unload

Page is disposed

Page Development
Demo

- Web Forms 101
- Show simple Web Form with server controls
- Dem

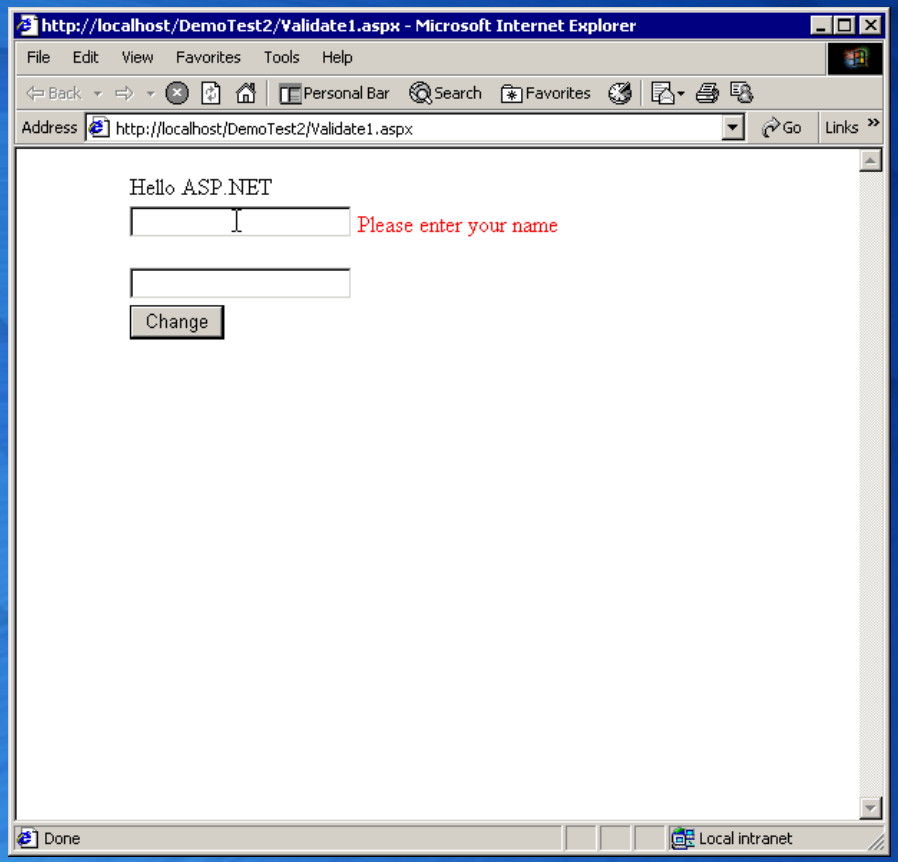


Page Development
Input Validation

- Rich and declarative Validation
- Validation controls declared separately for input controls
- Extensible Validation Framework
- Supports Validation on client and server
  - Avoids round trips for up-level clients

Page Development
Input Validation Demo

- **Validation Controls**
  - **Demo of Validation Control**

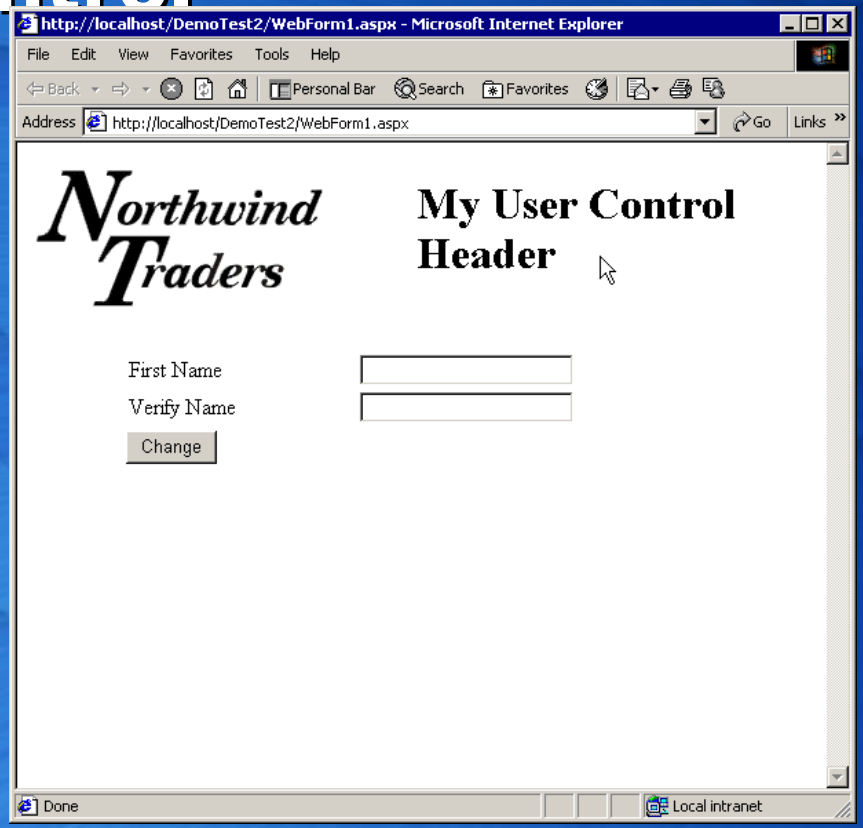


Page Development
Custom User Controls

- Simple way for page developers to author controls
- Enables full encapsulation
  - Supports nested controls
  - Separate code namespace
  - Separate code language
- Partition work across multiple developers
- Reuse work across multiple pages and applications

Page Development
User Controls Demo

- User Controls
- Show creation and use of simple User Control



“Baked-in” Application Services Topics

- Request processing
- Caching
- Security
- Session state
- Demo

“Baked-in” Application Services
Request Processing

- Pluggable, modular architecture
- “Baked-in” services for:
  - Caching
  - Security authentication/authorization
  - Session state

“Baked-in” Application Services
Caching

- Output caching
  - Serves rendered result of a page or partial page from cache
  - Big performance win: cached pages are as fast as static pages
  - Vary by params, language and user-agent
- Cache API
  - Enables arbitrary objects to be cached
    - Example: Result of database query
  - Can be a performance win
- User Control caching
- Scoped to application

“Baked-in” Application Services
Security

- Extensible security architecture
  - Pluggable authentication and authorization
  - Any credential store (e.g., Database)
- Out of box authentication support
  - Basic, Digest and NTLM
  - Forms-based authentication
  - Microsoft Passport authentication
- Extensible authorization support
  - Includes new Role-based Security architecture
- More detail in tomorrow’s Security module

“Baked-in” Application Services
Session State

- Session state can be external from ASP .NET process
  - ASPState: NT Service
  - SQL Server™ 7.0/2000 temporary database
- Big reliability wins
  - Session state survives crashes/restarts
- Enables Web farm deployment
  - Session state can be shared across a Web farm of ASP .NET servers
  - Applications are no longer tied to one

“Baked-in” Application Services

Session State Demo

- Session state
- Show using session state in the application

ASP .NET Runtime Topics

- Improved Reliability
- Improved Deployment

ASP .NET Runtime
Improved Reliability

- ASP .NET has been designed with the assumption that failures will occur on systems
  - Designing for failure-reduced fragility
- Detects/recovers from common problems
  - Access violations, memory leaks and deadlocks
- Pre-emptive cycling of applications
  - Time and request-based settings
- Users never will experience an ASP .NET application that is down or unavailable

ASP .NET Runtime
Improved Deployment

- Components can be dynamically updated
  - No more locked DLLs
  - Just copy a new DLL on top of an old one
- No tools, no configuration changes, no application shutdown and no re-boots
- Works great with Content Replication Systems

ASP .NET Runtime
Improved Deployment

Welcome
Hosting Services
Premier Hosting Services
These companies provide general access to database services based on .NET Enterprise servers, and offer developers a complete hosting solution, including all of the hardware, software, network equipment, and support necessary to run .NET-based XML Web services.
brinkster
Brinkster
Experience ASP and ASP .NET web hosting to the extreme at Brinkster. Two levels of membership - a free General Membership and a $12.95 Premium Membership, both hosted on active-active redundant server setups - enable unconstrained creativity in the design of fully functional and interactive Web sites. Brinkster membership at any level provides access to a proprietary CodeBank, articles, forums, and cutting-edge solutions.

EraServer.NET
EraServer
EraServer was one of the first dedicated ASP .NET hosting services on the Internet and remains dedicated to the mission of creating a .NET hosting site designed for developers and run by developers. Memberships start at $9.95 per month for 10 megabytes (MB) of space, full FTP access, remote access to Microsoft Visual SourceSafe, and more.

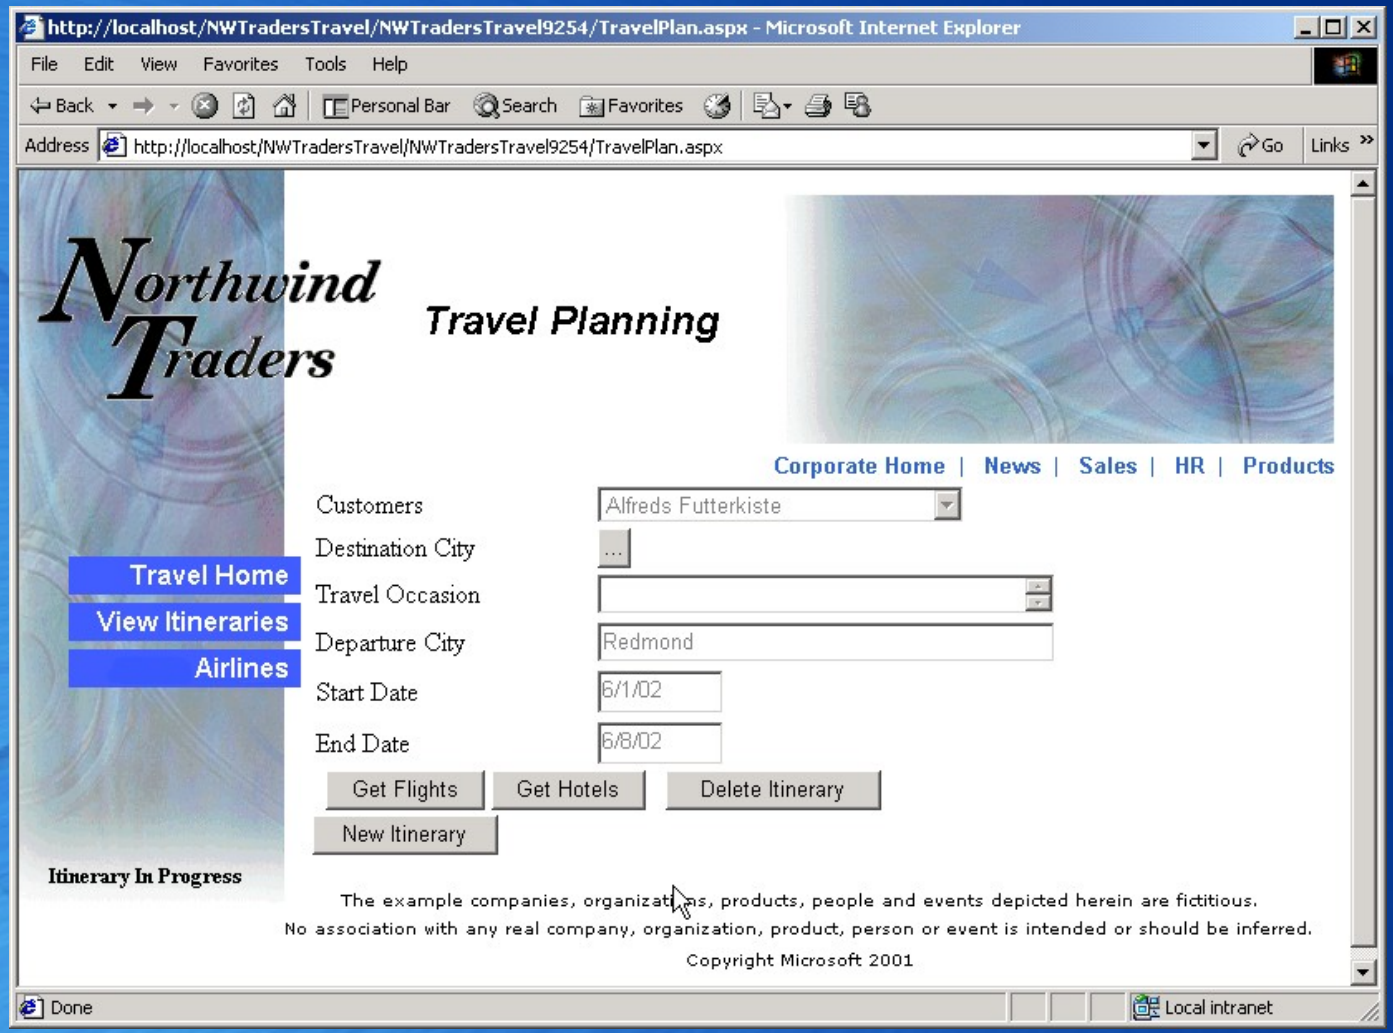
Sample Application
Demo

- NW Traders Travel and ASP .NET



Summary

- ASP .NET simplifies Web Application development
- Scalable, better performing applications
- Makes developers more productive
- Makes systems more reliable
- Makes systems easier to deploy
